Implement Client Script & UI Policy in ServiceNow

1. Introduction

Project Title

Implement Client Script & UI Policy in ServiceNow

Team Members

S.No	Team Member	Role

1	[Your Name]	Developer / ServiceNow Developer
2	[Team Member Name]	Tester
3	[Team Member Name]	Documentation
4	[Team Member Name]	Project Support

Replace the names above with your actual team members.

2. Project Overview

Purpose

The purpose of this project is to implement **Client Script and UI Policy functionality in ServiceNow** to improve the behavior and validation of Incident records.

The project demonstrates how ServiceNow can dynamically control form fields based on conditions. It helps ensure that important information is entered by users and improves the usability and data quality of the Incident form.

Key Features

The project includes:

- Incident form customization
- UI Policy creation
- Conditional field behavior
- Mandatory field validation
- Client-side form control
- Reverse UI Policy behavior
- Impact-based form customization
- Improved data validation
- Testing and validation of form behavior

Implemented UI Policy

UI Policy Name: High Impact Control

Table: Incident

Condition: Impact is **1 - High**

Action: Assignment Group is made **Mandatory**

Reverse if false: Enabled

When an Incident has **Impact = 1 - High**, the Assignment Group field becomes mandatory.

3. Architecture

ServiceNow Architecture

This project is implemented inside the ServiceNow platform rather than using a traditional MERN architecture.

Application Layer

The application uses the ServiceNow Incident Management module.

Business Logic Layer

The project uses:

- Client Scripts
- UI Policies
- UI Policy Actions
- Form conditions
- Client-side validation

Data Layer

The project uses the ServiceNow **Incident [incident] table** to store incident records.

Architecture Flow

4. Setup Instructions

Prerequisites

The following are required:

- ServiceNow Developer / Now Learning instance
- Valid ServiceNow login credentials
- Access to the Incident table
- Appropriate ServiceNow permissions
- Web browser such as Google Chrome or Microsoft Edge

Setup Steps

1. Log in to the assigned ServiceNow instance.
 2. Open the **All** menu.
 3. Navigate to the **System UI** or relevant configuration module.
 4. Open **UI Policies**.
 5. Create a new UI Policy.
 6. Select the **Incident** table.
 7. Enter the UI Policy name as **High Impact Control**.
 8. Set the condition to:
Impact is 1 - High
 9. Set the UI Policy to Active.
 10. Create a UI Policy Action.
 11. Select **Assignment group**.
 12. Set the field as **Mandatory**.
 13. Enable **Reverse if false**.
 14. Save the configuration.
 15. Open an Incident record and test the policy.
-

5. Folder Structure

Since this project is implemented directly in ServiceNow, a traditional React/Node folder structure is not used.

The project configuration is organized within the ServiceNow platform as follows:

ServiceNow Instance

6. Running the Application

The project runs directly on the ServiceNow instance.

Steps

1. Open the ServiceNow instance URL.
2. Log in with valid credentials.
3. Navigate to **All** → **Incidents**.
4. Open an existing Incident or create a new Incident.
5. Set **Impact = 1 - High**.
6. Observe the **Assignment Group** field.
7. The Assignment Group field should become mandatory.
8. Change Impact to another value.
9. With **Reverse if false** enabled, the mandatory behavior should be reversed.

No `npm start` command is required because this is a ServiceNow platform project.

7. Configuration / Implementation Documentation

UI Policy

Property	Value
UI Policy Name	High Impact Control
Table	Incident
Active	Yes

Condition Impact is 1 - High

Reverse if false Yes

UI Policy Action

Property	Value
Field	Assignment Group
Mandatory	True
Visible	Default
Disabled	Default

Working

User opens Incident

Selects Impact = 1 - High

UI Policy condition becomes TRUE

Assignment Group becomes Mandatory

User must provide Assignment Group

Incident can be submitted with required information

When the Impact value changes from **1 - High**, the reverse condition removes the mandatory requirement.

8. Authentication and Authorization

The project uses **ServiceNow's built-in authentication and authorization mechanisms**.

Users must log in to the ServiceNow instance using their assigned credentials.

Access to configuration features depends on the user's assigned roles and permissions.

For development and configuration activities, appropriate ServiceNow roles are required.

The project does not implement a separate JWT, session-management system, or custom authentication server because authentication is handled by the ServiceNow platform.

9. User Interface

The main user interface used in the project is the **ServiceNow Incident form**.

UI Components

- Incident Number
- Caller
- Short Description
- Description
- Impact
- Urgency
- Priority
- Assignment Group
- Assigned To
- State
- Additional Incident fields

UI Policy Behavior

When:

Impact = 1 - High

the system dynamically changes:

Assignment Group → Mandatory

This provides immediate feedback to the user without requiring a page reload.

Screenshots to Include

Add screenshots of:

1. UI Policy list
2. **High Impact Control** UI Policy
3. UI Policy condition

4. UI Policy Action
 5. Incident form before selecting High Impact
 6. Incident form after selecting High Impact
 7. Assignment Group showing mandatory behavior
 8. Successful Incident submission
-

10. Testing

Testing Strategy

The project was tested to verify that the Client Script and UI Policy behave correctly under different conditions.

Test Cases

Test Case ID	Test Scenario	Expected Result	Result
TC-01	Open Incident form	Form should load successfully	Pass
TC-02	Set Impact to 1 - High	UI Policy should activate	Pass
TC-03	Check Assignment Group	Assignment Group should become mandatory	Pass
TC-04	Submit without Assignment Group	System should prevent submission / require value	Pass
TC-05	Enter Assignment Group	Incident should accept the required field	Pass
TC-06	Change Impact from 1 - High	Mandatory behavior should be reversed	Pass
TC-07	Test with normal Impact	Assignment Group should not be unnecessarily mandatory	Pass

Testing Result

All major test cases were executed successfully and the UI Policy behavior was verified on the Incident form.

11. Screenshots or Demo

The following screenshots should be included in the final project documentation:

Screenshot 1 – UI Policy List

Show the UI Policy list containing:

High Impact Control

Screenshot 2 – UI Policy Configuration

Show:

- Name: High Impact Control
- Table: Incident
- Active: True
- Condition: Impact is 1 - High

Screenshot 3 – UI Policy Action

Show:

- Field: Assignment Group
- Mandatory: True

Screenshot 4 – Incident Form

Show the Incident form with:

Impact = 1 - High

and Assignment Group marked as mandatory.

Screenshot 5 – Successful Testing

Show the completed Incident record after providing the required Assignment Group.

12. Known Issues

The following are possible limitations of the project:

1. The UI Policy only works within the configured ServiceNow Incident form.
 2. The behavior depends on the configured Incident fields and conditions.
 3. Users without the required ServiceNow permissions may not be able to modify or configure the policy.
 4. The project is dependent on the availability of the ServiceNow instance.
 5. Any changes to Incident field names or configurations may require modification of the UI Policy.
-

13. Future Enhancements

The project can be enhanced in the future by implementing:

- Additional Client Scripts for advanced validation
 - More UI Policies for different Incident conditions
 - Automatic assignment of Assignment Groups
 - Automatic priority calculation
 - Dynamic field visibility
 - Automated notifications
 - Additional form validation
 - Business Rules for server-side validation
 - Automated testing
 - ServiceNow Flow Designer automation
 - Integration with external systems
 - Dashboard and reporting enhancements
-

Conclusion

The **Implement Client Script & UI Policy** project demonstrates how ServiceNow can be customized to provide dynamic and user-friendly Incident forms.

The **High Impact Control** UI Policy automatically makes the **Assignment Group** field mandatory when the Incident **Impact is set to 1 - High**. This improves data completeness and ensures that high-impact incidents contain the required assignment information.

The project was implemented, tested and validated using the ServiceNow platform and demonstrates practical knowledge of **UI Policies, Client Scripts, Incident Management and ServiceNow configuration**.
