

IMPLEMENT CLIENT SCRIPT & UI POLICY (INCIDENT)

Phase 1: Brainstorming & Ideation Phase

1. Document Information

Field	Details
Project Name	Implement Client Script & UI Policy (Incident)
Phase	Phase 1 – Brainstorming & Ideation
Platform	ServiceNow
Module	Incident Management
Table	Incident [incident]
Document Type	Project Phase Report
Phase Status	Completed

2. Introduction

The Brainstorming and Ideation Phase is the initial stage of the project “**Implement Client Script & UI Policy (Incident)**” in ServiceNow.

The primary purpose of this phase is to understand the existing Incident form, identify areas that can be improved, and generate possible ideas for providing a more efficient, user-friendly, and controlled Incident management experience.

During this phase, the project requirements are not yet implemented. Instead, the focus is on understanding the problem, discussing possible solutions, identifying required form behaviors, and defining the overall direction of the project.

The two main ServiceNow features considered during this phase are:

- **Client Scripts**
- **UI Policies**

These features can be used to dynamically control Incident form behavior and improve data quality.

3. Objective of the Phase

The main objectives of the Brainstorming and Ideation Phase are:

1. To understand the current Incident form and its usage.
 2. To identify problems or limitations in the existing form.
 3. To identify fields that may require dynamic behavior.
 4. To determine possible validation requirements.
 5. To identify opportunities to improve data accuracy.
 6. To explore the use of Client Scripts.
 7. To explore the use of UI Policies.
 8. To define an initial solution approach.
 9. To establish a foundation for detailed requirement analysis.
-

4. Problem Identification

During the initial analysis of the Incident management process, several potential issues were identified.

4.1 Incomplete Information

Users may submit Incidents without providing all the information required for proper investigation or resolution.

4.2 Incorrect Data Entry

Users may enter information that does not satisfy the expected business requirements.

4.3 Static Form Behavior

A standard Incident form may not dynamically change its behavior based on the values selected by the user.

4.4 Unnecessary Fields

Some fields may not be relevant in every situation and could potentially be hidden until they are required.

4.5 Missing Validation

Certain business rules may require client-side validation before an Incident can be submitted.

4.6 User Experience

Users may benefit from a form that dynamically responds to their selections instead of presenting the same behavior for every Incident.

5. Brainstorming Activities

The following activities are performed during this phase:

Activity 1 – Understand the Incident Process

The Incident creation and update process is reviewed to understand how users interact with the Incident form.

Activity 2 – Identify Form Fields

The important Incident fields are reviewed, such as:

- Caller
- Category
- Subcategory
- Impact
- Urgency
- Priority
- Assignment group
- Assigned to
- State
- Short description
- Description
- Resolution information

Activity 3 – Identify Dynamic Requirements

The team identifies fields that may need to change their behavior based on other field values.

For example:

When an Incident reaches the Resolved state, resolution-related information may need to be provided.

Activity 4 – Identify Validation Requirements

The team identifies information that should be validated before an Incident is submitted.

Activity 5 – Identify UI Improvements

Potential improvements involving:

- Mandatory fields
- Read-only fields
- Visible fields
- Hidden fields

are identified.

Activity 6 – Select Possible ServiceNow Features

The team evaluates whether the requirements can be implemented using:

- Client Scripts
- UI Policies
- Other ServiceNow configuration features

6. Proposed Ideas

Based on the brainstorming activities, the following ideas are proposed.

No.	Proposed Idea	Purpose
1	Make selected fields mandatory	Ensure required information is provided
2	Make fields read-only under	Prevent unwanted modifications

	specific conditions	
3	Dynamicaly show fields	Display relevant information when required
4	Dynamicaly hide fields	Reduce unnecessary form information
5	Validate user input	Prevent invalid or incomplete submissions
6	Display validation messages	Help users correct errors
7	Automatic ally control form behavior	Improve user experience

7. Client Script – Initial Idea

A Client Script is considered as a solution for requirements that require client-side scripting and validation.

Client Scripts can respond to actions performed by the user on the Incident form.

The following types of Client Scripts were considered:

Type	Initial Purpose
onLoad	Perform actions when the form loads
onChange	Perform actions when a field value changes
onSubmit	Validate information before submission
onCellEdit	Control list cell editing behavior

Initial Concept

For example, an **onSubmit Client Script** could check whether required resolution information has been entered before allowing an Incident to be submitted.

Conceptually:

Yes	No
↓	↓
Submit Incident	Display message and stop submission

This idea will be analyzed in greater detail during the Requirement Analysis Phase.

8. UI Policy – Initial Idea

UI Policies are considered for controlling the behavior of fields based on conditions.

A UI Policy can be used to:

- Make fields mandatory.
- Make fields non-mandatory.
- Make fields read-only.
- Make fields editable.
- Make fields visible.
- Hide fields.

Initial Concept

For example:

```

Condition:
State = Resolved
    ↓
UI Policy
    ↓
Resolution Notes
    ↓
Mandatory = True
  
```

This approach can provide dynamic form behavior without requiring scripting for simple field-control requirements.

9. Example Business Scenario

One of the possible scenarios identified during brainstorming is the Incident resolution process. When an Incident is moved to **Resolved**, resolution information should be available before the Incident is submitted.

Proposed Behavior

```

Incident State
    ↓
  
```

This scenario can potentially be implemented using:

- **UI Policy** – to make the appropriate resolution field mandatory.
- **Client Script** – to perform additional validation if the requirement needs scripting logic.

The exact implementation will be finalized during the Requirement Analysis and Design phases.

10. Initial Functional Requirements

The brainstorming session produces the following preliminary requirements:

Requirement 1

The system should dynamically make selected fields mandatory when specific conditions are satisfied.

Requirement 2

The system should prevent submission when required information is missing.

Requirement 3

The system should provide useful validation feedback to the user.

Requirement 4

The system should dynamically control field visibility where required.

Requirement 5

The system should dynamically control whether selected fields can be edited.

Requirement 6

The configuration should improve Incident data quality and user experience.

These requirements are preliminary and will be refined during the Requirement Analysis Phase.

11. Preliminary Solution Approach

The initial solution approach is to use a combination of **UI Policies** and **Client Scripts**.

UI Policies

UI Policies will be considered for simple field-level behavior such as:

- Mandatory
- Read-only
- Visible

Client Scripts

Client Scripts will be considered for:

- Complex validation
- Conditional logic
- Custom error messages
- Submission validation
- Dynamic client-side processing

Proposed Architecture

12. Expected Benefits

The proposed solution is expected to provide the following benefits:

Improved Data Quality

Required information can be enforced before an Incident is submitted.

Better User Experience

Users receive appropriate form behavior based on their selections.

Reduced Errors

Client-side validation can help prevent incorrect or incomplete submissions.

Dynamic Form Behavior

Fields can respond to conditions instead of behaving identically in every situation.

Easier Maintenance

Simple field behavior can be handled through UI Policies, reducing unnecessary scripting.

Better Incident Management

More complete and accurate Incident records can support the subsequent investigation and resolution process.

13. Assumptions

The following assumptions are made during the brainstorming phase:

1. The Incident table is available and accessible for configuration.
 2. The required ServiceNow roles and permissions are available.
 3. The project will follow the organization's ServiceNow development standards.
 4. Existing Incident functionality should not be unnecessarily affected.
 5. Changes will be tested before deployment.
 6. Client-side configurations will be used only where appropriate.
-

14. Constraints

Potential constraints identified during this phase include:

- Existing Incident configurations may affect the new behavior.
 - Existing Client Scripts or UI Policies may conflict with new configurations.
 - Business requirements may change during detailed analysis.
 - Some requirements may require server-side validation in addition to client-side validation.
 - The final implementation must follow the organization's ServiceNow standards.
-

15. Deliverables

The following deliverables are produced from the Brainstorming and Ideation Phase:

No.	Deliverable
1	Initial problem statement

2	List of improvement opportunities
3	Initial functional requirements
4	Proposed Client Script ideas
5	Proposed UI Policy ideas
6	Initial solution approach
7	Preliminary project scope

16. Phase Outcome

At the end of the Brainstorming and Ideation Phase, the project team has a clear understanding of the potential problems and improvement areas within the Incident form.

The use of **Client Scripts** and **UI Policies** has been identified as a possible approach for implementing dynamic form behavior, validation, and field control.

The preliminary requirements identified in this phase will be analyzed, refined, and converted into detailed functional and technical requirements during the next phase.

17. Conclusion

The Brainstorming and Ideation Phase establishes the foundation for the **Implement Client Script & UI Policy (Incident)** project.

The phase focuses on understanding the Incident form, identifying potential issues, generating solution ideas, and determining how ServiceNow Client Scripts and UI Policies can be used to improve the form.

The output of this phase provides the foundation for the **Requirement Analysis Phase**, where the identified ideas will be converted into clear and measurable requirements.
